

Your nutrition plan. Already *cooked*.

Nutrics is a personalized nutrition platform that turns individual nutrition targets and preferences into adaptive weekly meal plans, fulfilled by local kitchen partners.

TORONTO LAUNCH

Why eating well doesn't stick

Knowing what to eat isn't the hard part. Executing it every week is.

For the customer

- Nutrition goals are specific. meal-prep and meal-kit companies aren't.
- Repeating the same food makes adherence difficult.
- Tracking calories and macros creates constant work.
- Consistency breaks long before the goal changes.

For local kitchens

- Customer acquisition is expensive, and discount-led growth destroys margin.
- Personalization is hard to provide operationally — proprietary nutrition tech is unrealistic to build in-house.
- Existing capacity could serve more people if demand and planning were handled elsewhere.
- Meal-prep delivery companies lose up to 90% of customers within a year — running two low-margin businesses, food and delivery, at once.

Sources: The Wall Street Journal; Digiday, "meal delivery industry in starvation mode."

Nutrition target first. Real food supply second.

Continuous adaptation every week — software coordinates the nutrition, local kitchens provide the food.

"I liked the chicken, but give me different fish next week." → **Nutrics recalculates the next week automatically.**

"I'll be travelling next week — switch me to lunch and dinner only." → **Nutrics finds meals that maximize nutrition coverage across those two meals.**

"I'm cutting for a bodybuilding show — raise my protein for the next 4 weeks." → **Nutrics rebuilds your plan around higher protein, reverting after.**

Built — not just proposed.

The engine works with real recipes and portion sizes, not hypothetical recommendations — validated to hold ~92% average macro alignment even on a lean 20–40 recipe launch catalogue, tested across 5,000 simulated users.

Built. Ready to launch.

Product

- Live functional MVP
- Personalization engine built and tested
- Ready for commercialization

Supply

- Kitchen-partner pipeline developing
- Targeting 3–6 initial partners
- 20–40 standardized recipes/portion configurations

Market

- Toronto launch preparation underway
- Initial customer acquisition channels being developed
- Real-world validation begins with Toronto launch

The core technology is built and tested. The next challenge is commercial execution.

A marketplace model, without owning the kitchen.

Customer food spend → partner kitchen → Nutrics earns a 30% commission. Delivery is run in-house by Nutrics' own fleet, not a per-order fee. No mandatory subscription. Kitchens use capacity they already have.

\$4.01

Contribution margin per meal, after all variable costs

~\$231

Modelled acquisition spend per customer

750

Active customers, end of Year 1

\$17 customer meal spend → \$5.10 Nutrics revenue (30%) → variable costs → \$4.01 contribution margin

Per-meal economics — modelled, Year-1 base case

- Meal price, customer pays: **\$17** base (larger sizes ~\$20)
- Nutrics commission: **30%** of order value (kitchen keeps 70%)
- Customer food spend / GMV: ~\$680 /month ~\$8,160 /year **MODELLED**
- Nutrics revenue (30%): ~\$204 /month → ~\$2,448 /year **MODELLED**

Acquisition & breakeven — modelled

- Customer growth: **45 → 750** active customers over Year 1 (direct monthly ramp) **MODELLED**
- Marketing cost per acquired customer: ~\$231 (Year 1 marketing spend ÷ customers added) **MODELLED**
- Modelled operating breakeven: **375** active customers, ~Month 6 **MODELLED**

Nutrics scales through local supply. New cities require kitchen onboarding, logistics and demand generation — not building a new central kitchen.

What makes Nutrics hard to replicate

The intelligence sits between nutrition and food supply.

Traditional meal-prep

Menu first

Fixed portions

Fixed plans

One kitchen

Customer adapts to menu

Local meal providers can also become Nutrics kitchen partners.

Nutrition apps

Recommendations only

User still shops

User still cooks

User still tracks

No fulfillment

Nutrics

Nutrition target first

Plans built from real available meals

Multiple local kitchen partners

Portion-aware optimization

Plan adapts from continuous feedback

Food is actually fulfilled and delivered

More customers → richer feedback → better matching → more repeat orders → stronger kitchen demand → more supply → **better plans**. A compounding advantage we intend to build — not a guaranteed moat.

Competitors can become supply — Nutrics can aggregate meals from established local providers rather than building kitchens itself.

Four months to launch

Toronto, launching January 2027.

Solo founder, key hires shortlisted

Amritpal Moomie

FOUNDER

15 years building and shipping production software across startups and enterprise teams. Built the Nutrics product, engineering platform, and initial go-to-market foundation — solo, so far.

NEXT KEY HIRES, SHORTLISTED

Nutritionist / dietitian

Food standards + nutrition QA

Shortlisted: Jennifer Taylor — part-time to start

Operations / logistics

Kitchen coordination + delivery execution

Shortlisted: Jugal Mehta — part-time to start

Customer success

Retention + feedback loop

The MVP is ready. Now we need to prove it in market.

Nutrics has moved beyond the idea stage. The technology is built and our next step is launching in Toronto, activating local supply, and validating the model with real customers.

What Nutrics brings

- Live, functional MVP
- Personalization engine built and tested
- ~92% average macro alignment across 5,000 simulated users
- Toronto launch planned for January 2027
- Kitchen-partner pipeline in development
- Founder working full-time on execution

What we want to accomplish with MaRS

- Successfully launch the Toronto pilot
- Activate our first kitchen partners
- Acquire and retain our first paying customers
- Validate real-world unit economics and customer behaviour
- Strengthen marketplace and supply-chain operations
- Build a repeatable playbook for expansion beyond Toronto

Nutrics enters MaRS with a working product ready for market — **and a clear set of commercialization milestones to validate next.**
