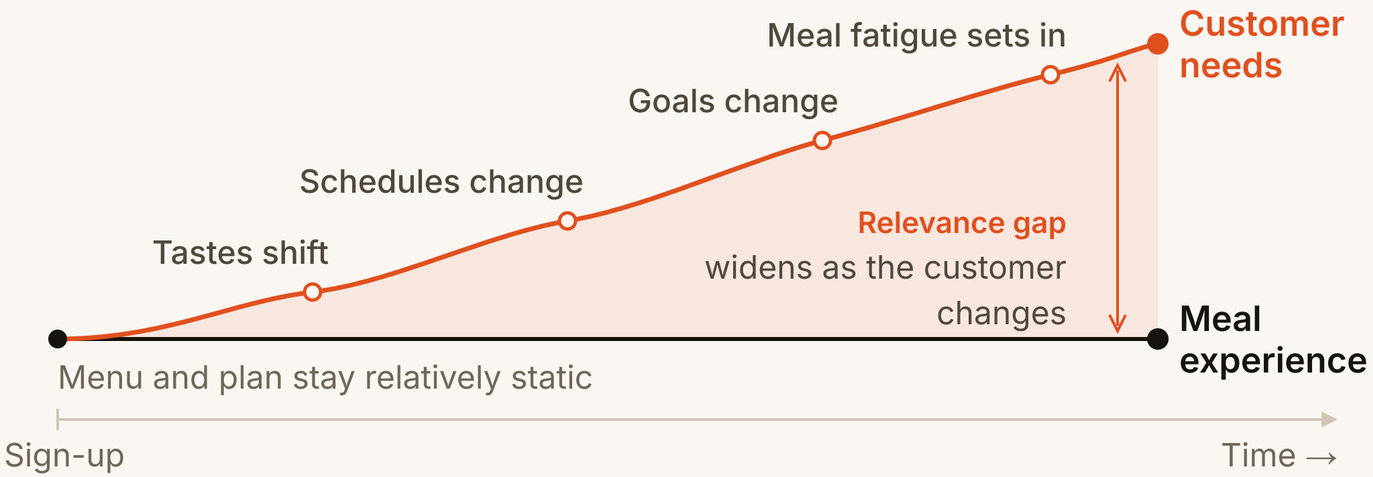
External benchmark, not Nutrics data

Meal delivery solved convenience. It didn’t solve staying relevant.

CONCEPTUAL — NOT DATA



What the published benchmarks suggest

~74%

annualized churn benchmark for meal-kit subscriptions

Cited reasons for cancelling

33% **Meal fatigue & menu repetition**
→ the experience stays static

13% **Lifestyle changes**
→ the customer changes

54% **Price, logistics & food waste**
→ not a personalization problem

Customers change every week. Their meal plan should too.

Chart is conceptual, not data. Churn estimate (73.6% annualized) and cited-reason split: RetentionCheck, “Meal Kit Subscription Churn Benchmarks,” updated May 2026 — editorial estimates anchored to published industry ranges; not audited industry statistics and not Nutrics data. Meal kits are the closest published benchmark; Nutrics sells prepared meals.

The customer shouldn’t have to keep adapting to the meal service.

STATIC EXPERIENCE

The customer does the adapting.

- **Customer changes** — taste · schedule · goals
- Menu stays relatively static
- Search · swap · skip · reconfigure — customer
- More effort with every change — customer
- Relevance can decline
- Cancellation risk

ADAPTIVE EXPERIENCE

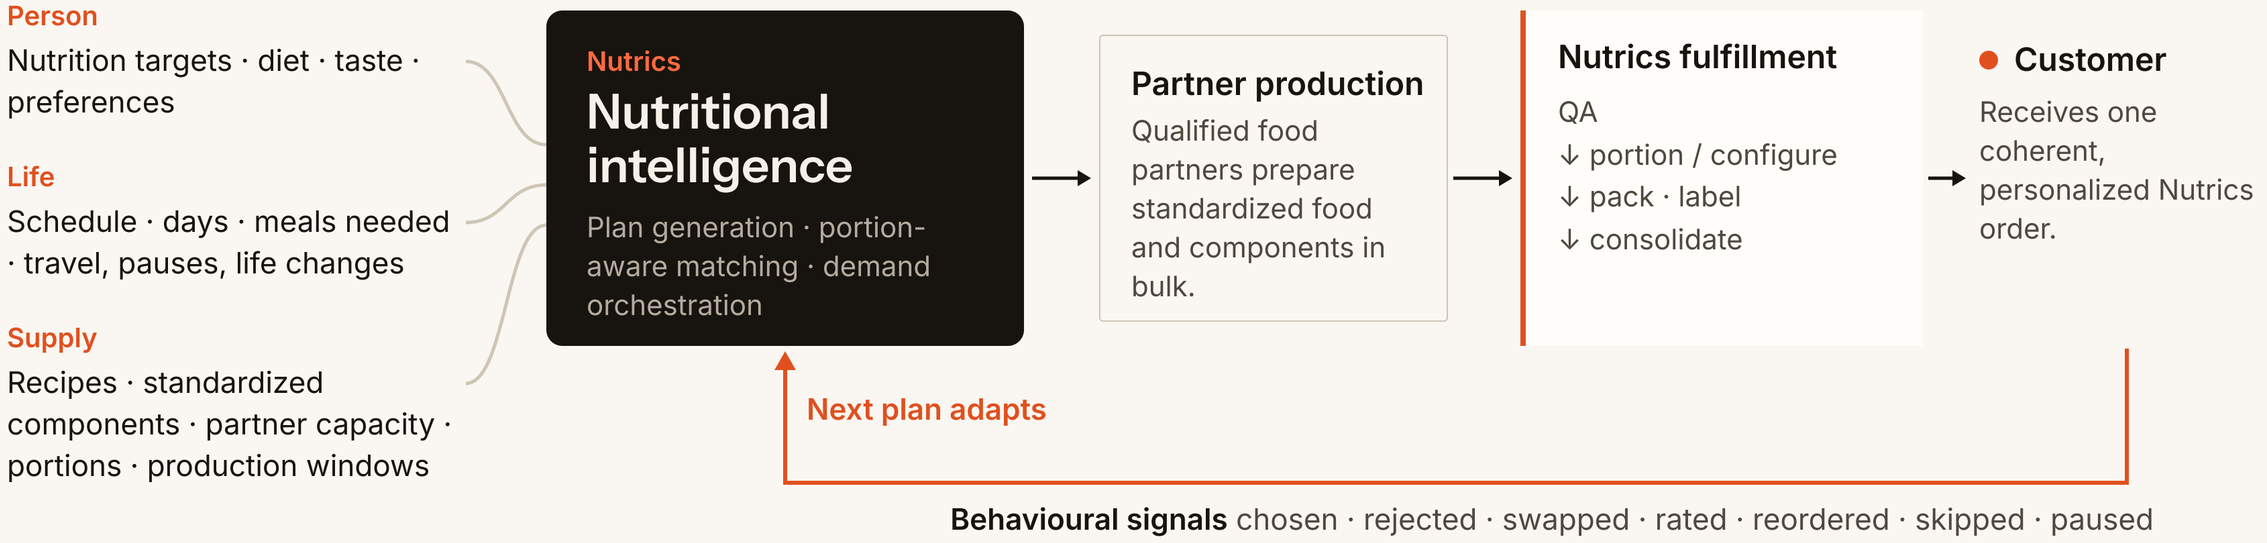
The product does more of the adapting.

- **Customer changes** — taste · schedule · goals
- System observes the change — product
- Plan recalculates — product
- Meals + portions adapt — product
- Customer responds — new signal
- **Next plan learns** — product

Nutrics is designed to move the adaptation burden to the product.

Hypothesis, not a result: improved repeat purchase and retention are to be validated through commercial operations. Research context: personalized nutrition advice improved dietary intake more than generic advice across 11 RCTs [1] — a diet-quality finding, not a retention finding. [1] Jinnette R et al. Adv Nutr 2021;12(3):657–669

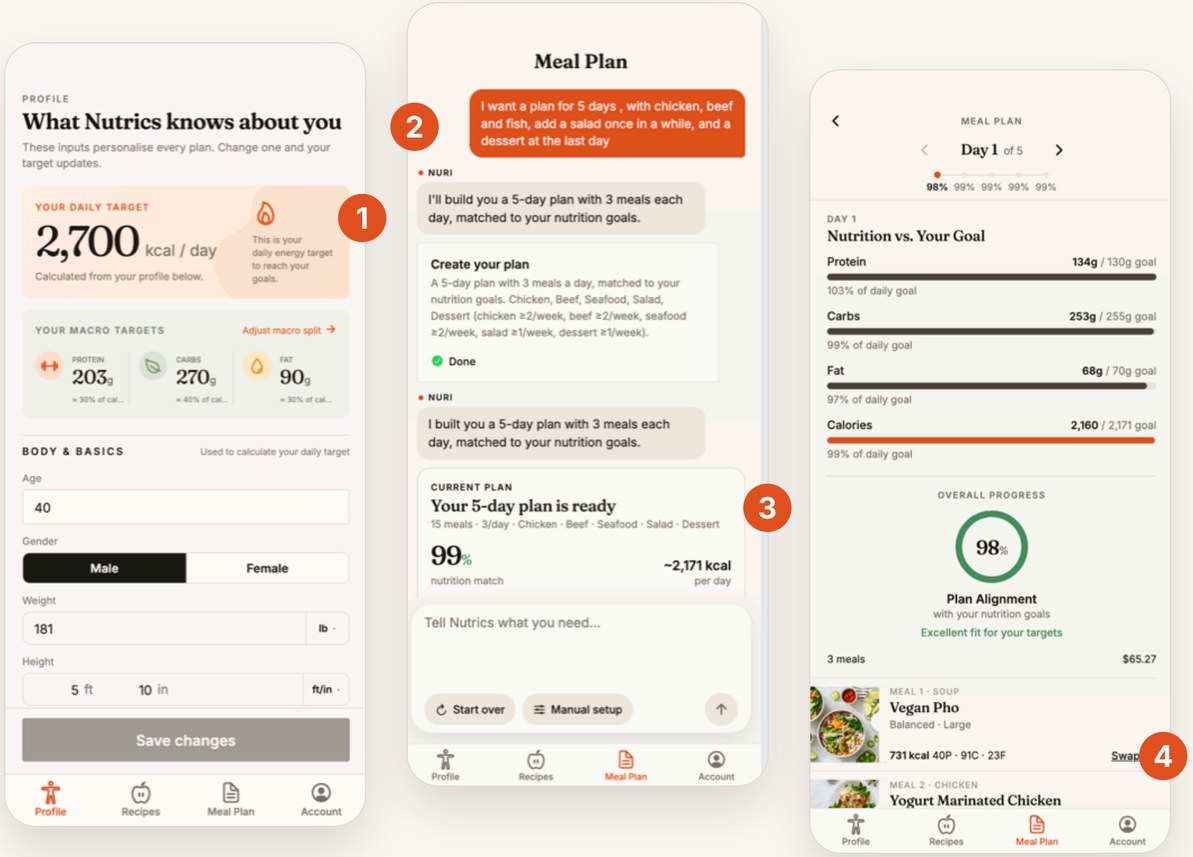
The food is the output.
The intelligence is the product.



The menu adapts to the customer, not the other way around.

The loop shows how Nutrics is designed to work. Plan generation, portion-aware matching and swaps run in the MVP today (04). Partner production, Nutrics fulfillment and learning from live behaviour begin with V2 commercial operations; no food-partner agreements are signed yet.

Built — not just proposed.



1 **Profile** — nutrition target set

2 **Ask** — a plan in plain language

3 **Plan** — built from real, available meals

4 **Swap** — adapt one meal, keep the plan

This is the first version of the adaptive loop.

Proven today

- Working live product
- Matching engine
- Plan generation
- Portion-aware selection
- Macro-alignment capability

Not yet proven

- Willingness to pay
- Repeat purchase at scale
- Retention

What this round tests (10)

INTERNAL SIMULATION · NOT CUSTOMER DATA

92% average macro alignment · 5,000 simulated profiles · representative 30–45 recipe catalogue

app.nutrics.ca

92% is an internal simulation of the Nutrics matching engine on a representative 30–45 recipe catalogue: product proof, not customer outcome data. Screens: live MVP at app.nutrics.ca with one example profile; per-plan match figures in the screens apply to that profile only.

Pre-launch targets, to be proven

We buy food at wholesale. We sell personalized meals at retail.

money — food

Customer

Sets targets and preferences, chooses, swaps, rates.

Retail meal price + C$9.99 per drop →

← One personalized order

Nutrics

Plan + customer

- Customer relationship
- Nutritional intelligence
- Personalization
- Retail pricing
- Demand aggregation
- Feedback + data

Nutrics microhub

- QA
- Portion configuration
- Packing + labelling
- Consolidation
- Route preparation

Wholesale price →

← Standardized food and components

Food partners

Ingredient sourcing
Culinary production
Standardized preparation
Sell to Nutrics at wholesale

~46%

target meal gross margin*

Retail meal revenue − partner wholesale food cost only.

Before Nutrics fulfillment and logistics costs.

Outside the 46%

Microhub labour · individual portioning · packaging + labels · inbound partner movement · cold chain · waste · payments · last-mile delivery · refunds

C$9.99 per delivery drop

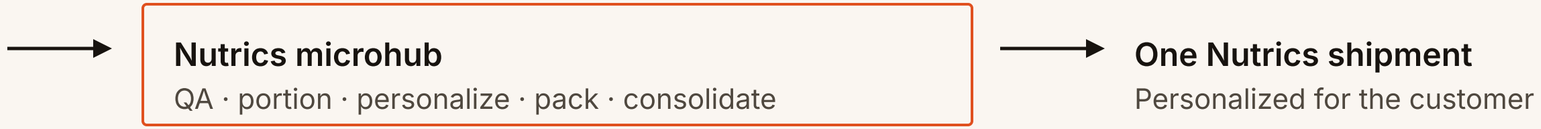
Separate delivery revenue with its own cost structure. Not pure profit.

Kitchen-light: food partners cook; Nutrics owns the customer, the plan and the final order.

*Meal gross margin = retail meal revenue minus food-partner wholesale food cost. A pre-launch target, not contribution margin. It excludes microhub labour, individualized portioning, packaging, labels, inbound partner movement, cold-chain handling, waste, payment processing, last-mile delivery and refunds or replacements where applicable. Contribution margin is not yet known. Food-partner outreach is underway; no agreements are signed yet.

Different architecture. Different optimization problem.

	Factor	CookUnity	Nutrics (planned V2 model)
Who cooks	Factor's chefs, in company-run production kitchens	Partner chefs and their teams, in CookUnity kitchens	Independent, qualified commercial food partners
What arrives	Fully prepared meals from the weekly menu; heat and eat	Fully prepared chef dishes; heat and eat	A plan assembled from individually portioned and configured food
Personalization	Filter the weekly menu by dietary preference, e.g. Keto or Calorie Smart	Personalized recommendations and meal discovery	Portion-aware planning to each person's nutrition target
Primary customer experience	Choose prepared meals organized around dietary and nutritional preferences	Choose from a broad chef-driven prepared-meal catalogue	Receive a plan assembled around individual nutrition targets, preferences, schedule and available supply



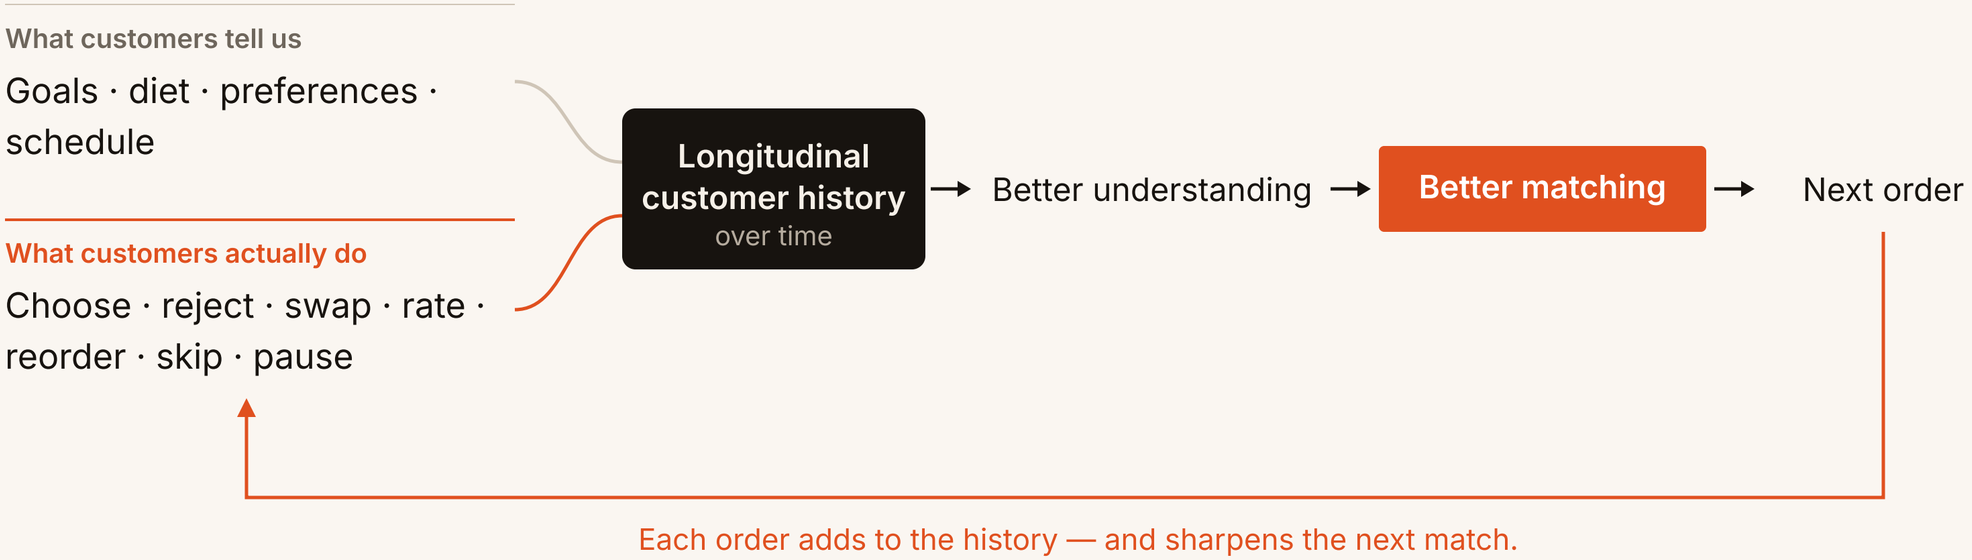
Nutrics avoids owning large production kitchens while keeping control of personalization, quality and the customer experience.

Competitor cells summarize their public descriptions: factor75.com and menus and plans; cookunity.com and support.cookunity.com (accessed 29 Sep 2026); Food Business News, 2023 and 2022. The Nutrics column is the planned V2 model; the food-partner network and microhub are not yet operating.

Prospective, not yet an advantage

Every order gives Nutrics more to learn from.

Designed to compound as real customer interactions accumulate.



A competitor can copy the interface. It cannot instantly copy the history.

V2 does not yet have a live longitudinal customer dataset. Historical V1 customer and operating records exist, but the compounding advantage described here begins with commercial use of the rebuilt platform — it is the advantage Nutrics is designed to build, not one it already has, and a well-funded competitor could build its own. Research context: few AI dietary-intervention studies have assessed long-term adherence [2]. [2] Wang X, Sun Z, Xue H, An R. Healthcare 2025;13(12):1417

Prove the operating cell before replicating it.

01 Toronto / GTA beachhead · launch planned January 2027

150
recurring customers

~10
meals per customer, per week

≈1,500
meals per week

Focused initial food-partner network
Final launch count depends on validated partner capacity and economics.

Launch targets and planning assumptions. Not yet achieved.

What Toronto must prove

- Paid demand
- CAC + conversion
- Repeat purchase
- Retention
- Contribution margin
- Delivery density
- Food-partner economics
- Fulfillment economics
- Operational reliability

The city operating cell

Food-partner network
Local kitchens cook standardized components

Nutrics microhub
QA, portioning, packing, consolidation

+

Delivery density
Enough drops per route to cover delivery cost

Nutrics software
Planning, matching, demand allocation

→ repeat in the next dense geography

02 Repeat the city cell across Canadian metros, only after Toronto proves it.

C$5.0B Canadian ready-meals market, 2025 [1]

03 Platform expansion, later: tools for dietitians and partners.

US$30.9B global personalized-nutrition forecast, 2030 [2]

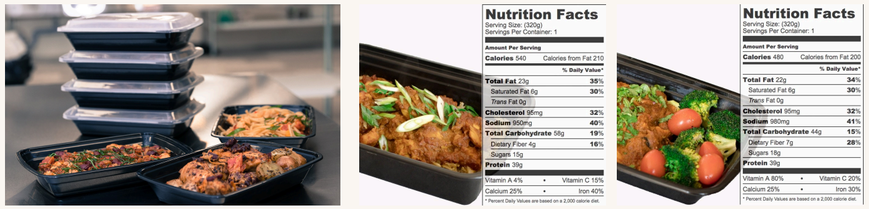
Scale the network, not the kitchen.

Toronto figures are launch targets and operating assumptions, not achieved numbers; no city-level market size is claimed. The two market figures use different definitions and are never added together; Nutrics does not assume it captures either. [1] GlobalData, Canada Ready Meals Market ... to 2030, Jul 2026 (C$5,000.5M, 2025) · [2] MarketsandMarkets, Personalized Nutrition Market, Global Forecast to 2030

09 · FOUNDER

I built the first Nutrics.
It taught me how to build the second.

Commercial kitchen, Dec 2017



Packed meals · one dish, two hand-built nutrition labels (Feb 2018)

Amritpal Moomie
Founder

15 years building production software systems. Built the current Nutrics MVP, matching engine and platform. Previously operated Nutrics V1.

- **Built it** · Nutrics V1, 2017–2018

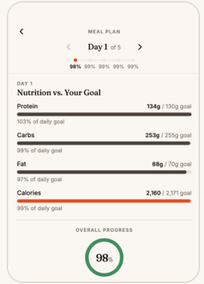
  A real prepared-meal business: commercial food production, weekly menus, paid customers, online ordering, nutritional variants, culinary staff and recurring GTA delivery.

- **Learned from it**

  Food operations punish complexity. Every hand-made nutrition variant added a recipe, portion, label and prep step.
  Delivery is part of the product. Cutoffs, windows and small-order economics shaped the customer experience.
  The first order is only the beginning. The product has to stay useful as the customer's life and needs change.

- **Rebuilt the architecture**

Owned kitchen	→	Distributed food partners
Manual personalization	→	Software-driven personalization
Fixed production constraints	→	Structured Nutrics fulfillment
	+	Adaptive customer loop



V1 did not become the final company. It became the evidence and experience behind the next one.

Documented V1 facts: Nutrics V1 Operating Evidence & Outcomes (Sep 2026) — archive covers Mar 2017 to Apr 2018. Lessons are the founder's interpretation, not audited findings. The archive does not establish total customers, revenue, profitability, retention or a shutdown cause; none is claimed. Photos: original V1 archive. App: current Nutrics MVP.

10 · THE RAISE

C$600K to turn a working product into commercial proof.

C$600K pre-seed

≈ US$423K* · Toronto launch planned January 2027

What this round must prove

- Paid demand
- CAC
- Repeat purchase
- Retention
- Operational reliability
- Contribution economics
- Food-partner economics
- Fulfillment economics
- Delivery economics

Use of funds

Product + data
Customer acquisition
Nutrition + team
Fulfillment + logistics
Working capital

Planned key hires

Nutrition Lead / Nutritionist
Fulfillment Operations Lead
Logistics Coordinator

We're not raising to prove we can build it.
We're raising to prove customers will buy, return, and generate positive contribution.

Nutrics has a solo founder today; the three hires above are planned and funded by this round, not yet made. Positive contribution is what this round tests, not a current result. *USD equivalent approximate, based on the Bank of Canada daily rate as of 29 Sep 2026 (US$1 = C$1.4188).
